

App. No. 09/927,096  
Amendment Dated: December 1, 2006  
Reply to final Office Action of September 1, 2006

**Listing of Claims:**

1 (Currently amended): A computer-readable medium having computer-executable components, comprising:

a search engine manager configured to receive a search query from a client and to translate the search query to a standard query, wherein the standard query is universally formatted for a plurality of search engine wrappers registered with the search engine manager, and to communicate the standard query from the search engine manager to a each of the plurality of search engine wrappers registered with the search engine manager; and

each of the search engine wrappers being configured to translate the standard query to a native format query of a registered search engine associated with the search engine wrapper, wherein each of the search engine wrappers translates the standard query into a different native format, and to communicate the native format query to the registered search engine, the search engine wrapper being further configured to return results from the registered search engine to the search engine manager.

2 (Previously presented): The computer-readable medium of claim 1, wherein the search engine manager further comprises:

a client interface configured to allow the search engine manager to communicate with the client;

a query generation module configured to receive the search query from the client interface and to generate the standard query; and

a wrapper interface configured to provide the standard query to the search engine wrapper.

3 (Currently amended): The computer-readable medium of claim 1, wherein each of the search engine wrappers further comprise[s]:

a manager interface configured to provide standardized communication between the search engine wrapper and the search engine manager;

App. No. 09/927,096  
Amendment Dated: December 1, 2006  
Reply to final Office Action of September 1, 2006

a query translation module configured to translate the standard query received from the search engine manager into the native format query ~~associate~~ associated with the registered search engine; and

a search engine interface configured to allow the search engine wrapper to communicate with the registered search engine in the native format of the registered search engine.

4 (original): The computer-readable medium of claim 3, wherein the manager interface includes a COM (Component Object Model) interface.

5 (original): The computer-readable medium of claim 3, wherein the search engine interface includes a COM (Component Object Model) interface.

6 (Cancelled)

7 (Currently amended): A computer-implemented method for communicating between a client and a plurality of search engines in a distributed processing system, comprising the steps of:

~~at a search engine manager;~~

receiving a search query, at a search engine manager, having a plurality of search parameters, the search query being generated by a search client;

building a standard query from the search query, wherein the standard query is universally configured to be understandable by a plurality of search engine wrappers; ~~and~~

issuing the standard query to each of the plurality of search engine wrappers;

~~at each of the plurality of search engine wrappers;~~

receiving the standard query at each of the plurality of search engine wrappers;

at each of the plurality of search engine wrappers, translating the standard query to a native format query for a search engine associated with the search engine wrapper, wherein the native format query is unique to the search engine associated with the search engine wrapper; and

App. No. 09/927,096  
Amendment Dated: December 1, 2006  
Reply to final Office Action of September 1, 2006

issuing, from each of the search engine wrappers, the unique native format query to the search engine associate with the search engine wrapper.

8 (original): The method of claim 7, wherein each search engine wrapper is configured to issue a progress update and a wrapper ID to the search engine manager.

9 (original): The method of claim 7, wherein the search engine manager is configured to disable issuing the standard query to a selected search engine wrapper in accordance with the search query.

10 (original): The method of claim 7, wherein issuing the standard query to each of the plurality of search engine wrappers is facilitated by a standardized interface.

11 (original): The method of claim 10, wherein the standardized interface includes a COM (component object model) interface.

12 (original): The method of claim 11, wherein each of the plurality of search engine wrappers are registered with the search engine manager to provide searching capabilities.

13 (Currently amended): A computer-readable medium having computer-executable instructions for performing steps, comprising:

registering a search engine with a search engine manager to provide searching capabilities;

receiving, at a the search engine manager, a client query from a client;

building a standard query from the client query received from the client, wherein the standard query is universally formatted for wrappers;

passing the standard query from the search engine manager to a plurality of wrappers, wherein each of the plurality of wrappers is associated with a different registered search engine associated with the registered search engine;

App. No. 09/927,096  
Amendment Dated: December 1, 2006  
Reply to final Office Action of September 1, 2006

translating, at each of the wrappers, the standard query to a translated query in a native format of the registered search engine associated with the wrapper, wherein each of the wrappers translates the standard query into a different native format;

transmitting the translated query to the registered search engine; and  
receiving results of the translated query from the registered search engine.

14 (original): The computer-readable medium of claim 13, wherein registering the search engine further comprises registering an associated wrapper with a common registration service.

15 (original): The computer-readable medium of claim 14, wherein registering the associated wrapper further comprises storing a wrapper ID which uniquely identifies the associated wrapper, and storing other information, in a database associated with the common registration service.

16 (original): The computer-readable medium of claim 13, wherein passing the standard query from the search engine manager is performed through a standardized interface allowing for a multiplicity of wrappers associated with other search engines to receive the standard query.

17 (original): The computer-readable medium of claim 15, wherein the standardized interface includes a COM (Component Object Model) interface.

18 (original): The computer-readable medium of claim 13, wherein building the standard query further comprises combining, by a query generation module, the client query with other parameters received from the client.

19 (original): The computer-readable medium of claim 13, wherein translating the standard query further comprises transforming the standard query to the native format of the search engine through the use of a translation module.

App. No. 09/927,096

20 (original): The computer-readable medium of claim 13, wherein receiving the results further comprises enumerating the results, returning the wrapper ID to the search engine manager, and returning progress updates to the manager until the results are returned.

21 (Currently amended): A computer-readable medium having computer-executable instructions for performing steps, comprising:

- discovering at least one search engine registered with a search system;
- receiving a query initiated by a client accessing the search system;
- building a standard query from the query initiated by the client, wherein the standard query is universally configured to be understandable by a plurality of engine wrappers;
- transmitting the standard query to a plurality of search engine wrappers, wherein each search engine wrapper is configured to translate the search query into a native format that is unique to a search engine registered with the search engine wrapper; at least one search engine wrapper configured to translate the standard query to a native format query associated with the at least one search engine registered with the search system;
- requesting a response from ~~the at least one~~ each of the search engine wrappers the response including a progress update for the standard query as it is executed and the results of the standard query; and
- receiving the responses from ~~the at least one~~ each of the search engine wrappers.

22 (Currently amended): The computer-readable medium of claim 21, wherein discovering ~~a~~ at least one search engine registered with the search system further comprises accessing a search engine store to retrieve identification information for the at least one search engine registered with the search system.

23 (original): The computer-readable medium of claim 21, wherein receiving the query initiated by a client further comprises receiving the query through a COM interface.

App. No. 09/927,096

Reply to final Office Action of September 1, 2006

24 (Currently amended): The computer-readable medium of claim 21, wherein building the standard query further comprises using a query generation module ~~to generate a standard query that is in the format of the at least one search engine wrapper.~~

25 (original): The computer-readable medium of claim 21, wherein transmitting the standard query further comprises not transmitting the standard query to a search engine wrapper that is excluded by the client.

26 (original): The computer-readable medium of claim 21, wherein the response received indicates that the standard query is complete.

27 (original): The computer-readable medium of claim 21, wherein the response received indicates that the standard query failed because a time limit for receiving a response is exceeded.

28 (original): The computer-readable medium of claim 21, wherein the response indicates that the standard query is because the at least one search engine associated with the at least one search engine wrapper is not finished with its associated native format query.

29 (Currently amended): A computer-readable medium having computer-executable instructions for performing steps, comprising:

receiving a standard query from a search engine manager, wherein the standard query is universally configured to be understandable by a plurality of engine wrappers;

translating the standard query, at a search engine wrapper, into a native format query, wherein the native format query is specific to a search engine associated with the search engine wrapper associated with at least one search engine;

transmitting the native format query associated with the at least one search engine to the at least one search engine;

transmitting a progress update to the search engine manager for the standard query as it is executed;

App. No. 09/927,096  
Amendment Dated: December 1, 2006  
Reply to final Office Action of September 1, 2006

receiving results from the at least one search engine; and  
transmitting the results received from the at least one search engine to the search engine manager.

30 (original): The computer-readable medium of claim 29, wherein receiving a standard query further comprises receiving the standard query through a COM interface.

31 (original): The computer-readable medium of claim 29, wherein translating the standard query into a native format query further comprises using a translation module.

32 (original): The computer-readable medium of claim 29, wherein the native format query is different for each of the search engines when multiple search engines are used.

33 (original): The computer-readable medium of claim 29, wherein transmitting the native format query further comprises dynamically altering parameters of the native format query according to the search engine.

34 (original): The computer-readable medium of claim 29, wherein transmitting a progress update further comprises transmitting an identification parameter for identifying the at least one search engine.

35 (original): The computer-readable medium of claim 29, wherein the at least one search engine is stopped from continuing to execute the native format query when a time limit for receiving a response is exceeded.

36 (original): The computer-readable medium of claim 29, wherein transmitting the results received from the at least one search engine further comprises transmitting the results in response to a request for the results from the search engine manager.
